

HDI Predictor Documentation

Empathy Map

Date	10 June 2025
Team ID	SB-GENAI-HDI-2025
Project Name	HDI Predictor - Human Development Index Classification System
Prepared By	Kankipati Sai Venkat

Persona: Meera, a Development Policy Analyst (Role: Researcher / User Type: Data-driven decision maker)

SAYS	THINKS
"I need to know instantly which countries need the most support."	"Is there a faster way to classify countries than looking up published HDI tables every time?"
"I want to test what happens if schooling improves by two years."	"I wish I could trust a tool's classification without re-deriving the index by hand."
"Show me which indicator is really holding this country back."	"A single composite score hides a lot — I need to see the contributing factors."

DOES	FEELS
Cross-references UNDP reports and World Bank datasets manually	Frustrated by fragmented, static data sources
Builds ad-hoc spreadsheets to estimate HDI tiers for shortlists of countries	Confident when a tool's output matches known official rankings
Presents findings to program leadership under time pressure	Anxious about presenting an inaccurate classification to stakeholders

Key Insight: Meera doesn't need a research-grade statistics package — she needs a fast, trustworthy, input-in/answer-out tool that classifies development level from a small set of well-known indicators, with enough transparency to defend the result to her team.
